

750VA Transformer Wiring Diagram to 3 TempZone™ **Single Conductor 24V Rolls**

NOTE: The 750 VA transformer can handle up to a total of 750 watts of low voltage warming rolls. If the total watts requirements of all the rolls exceeds 750 watts, a larger capacity transformer will be needed. To avoid nuisance GFCI tripping, please use plenty of electrical tape to prevent arcing between the conductors and their respective braids/ shields.
